# Linear Mixed Effects Models

$$\begin{aligned} y_{ij} &= \beta^T x_{ij} + \gamma^T z_{ij} + \epsilon_{ij}, & \epsilon_{ij} &\stackrel{iid}{\sim} N(0, \sigma^2) \\ \gamma_j &\stackrel{iid}{\sim} N_p(0, \Sigma) \end{aligned}$$

- Fixed effects contribution  $\beta^T x_{ij}$ ,  $x_{ij}$  is a  $d \times 1$  vector with  $\beta$  is constant across groups  $j$ ,  $j = 1, \dots, J$
- Random effects  $\gamma_j^T z_{ij}$ ,  $z_{ij}$  is a  $p \times 1$  vector with  $\gamma_j \stackrel{iid}{\sim} N_p(0, \Sigma)$  for groups  $j = 1, \dots, J$
- Designed to accomodate correlated data due to nested/hierarchical structure/repeated measurements
- students w/in schools; patients w/in hospitals; additional covariates
- As before not inherently Bayesian! It's just a model/likelihood specification! Population parameters,  $\theta = (\beta, \Sigma, \sigma^2)$

# Likelihoods

- Complete Data Likelihood  $(\{\gamma_i\}, \theta)$

$$L(\{\beta_i\}, \theta) \propto \prod_j N(\gamma_j; 0, \Sigma) \prod_i N(y_{ij}; \beta^T x_{ij} + \gamma_j^T z_{ij}, \sigma^2)$$

- Marginal likelihood based on just observed data  $(\{y_{ij}\}, \{x_{ij}\}, \{z_{ij}\})$

$$L(\{\beta_i\}, \theta) \propto \prod_j \int N(\gamma_j; 0, \Sigma) \prod_i N(y_{ij}; \beta^T x_{ij} + \gamma_j^T z_{ij}, \sigma^2) d\gamma_j$$

- Option A: we can calculate this integral by brute force algebraically
- Option B: (lazy option) We can calculate marginal exploiting properties of Gaussians as sums will be normal - just read off the first two moments!

# Marginal Distribution

- Express observed data as vectors for each group  $j$ :  $(Y_j, X_j, Z_j)$  where  $Y_j$  is  $n_j \times 1$ ,  $X_j$  is  $n_j \times d$  and  $Z_j$  is  $n_j \times p$ ;
- Group Specific Model (1):

$$Y_j = X_j\beta + Z_j\gamma_j + \epsilon_j, \quad \epsilon_j \sim N(0, \sigma^2 I_{n_j})$$
$$\gamma_j \stackrel{iid}{\sim} N(0, \Sigma)$$

- Population Mean  $E[Y_j] = E[X_j\beta + Z_j\gamma_j + \epsilon_j] = X_j\beta$
- Covariance  $V[Y_j] = V[X_j\beta + Z_j\gamma_j + \epsilon_j] = Z_j\Sigma Z_j^T + \sigma^2 I_{n_j}$
- Group Specific Model (2)

$$Y_j \mid \beta, \Sigma, \sigma^2 \stackrel{ind}{\sim} N(X_j\beta, Z_j\Sigma Z_j^T + \sigma^2 I_{n_j})$$

# Priors

- Model (1) leads to a simple Gibbs sampler if we use conditional (semi-) conjugate priors on  $\theta = (\beta, \Sigma, \phi = 1/\sigma^2)$

$$\beta \sim N(\mu_0, \Psi_0^{-1})$$

$$\phi \sim \text{Gamma}(v_0/2, v_0\sigma_0^2/2)$$

$$\Sigma \sim \text{IW}_p(\eta_0, \mathbf{S}_0^{-1})$$

# Conditional posterior for $\Sigma$

$$Y_j \mid \beta, \gamma_j, \sigma^2 \stackrel{\text{ind}}{\sim} N(X_j\beta + Z_j\gamma_j, \sigma^2 I_{n_j})$$

$$\gamma_j \mid \Sigma \stackrel{\text{iid}}{\sim} N(0, \Sigma)$$

$$\Sigma \sim \text{IW}_p(\eta_0, \mathbf{S}_0^{-1})$$

$$\beta \sim N(\mu_0, \Psi_0^{-1})$$

$$\phi \sim \text{Gamma}(v_0/2, v_0\sigma_0^2/2)$$

- The conditional posterior (full conditional)  $\Sigma \mid \gamma, \mathbf{Y}$ , is then

$$\begin{aligned} \pi(\Sigma \mid \gamma, \mathbf{Y}) &\propto \pi(\Sigma) \cdot \pi(\gamma \mid \Sigma) \\ &\propto \underbrace{|\Sigma|^{\frac{-(\eta_0 + p + 1)}{2}} \exp\left\{-\frac{1}{2}\text{tr}(\mathbf{S}_0 \Sigma^{-1})\right\}}_{\pi(\Sigma)} \cdot \underbrace{\prod_{j=1}^J |\Sigma|^{-\frac{1}{2}} \exp\left\{-\frac{1}{2}[\gamma_j^T \Sigma^{-1} \gamma_j]\right\}}_{\pi(\gamma \mid \Sigma)} \end{aligned}$$

- $\Sigma \mid \{\gamma_j\}, \mathbf{Y} \sim \text{IW}_p\left(\eta_0 + J, (\mathbf{S}_0 + \sum_{j=1}^J \gamma_j \gamma_j^T)^{-1}\right)$

# Posterior Continued

$$\begin{aligned}\pi(\Sigma \mid \gamma, \mathbf{Y}) &\propto \pi(\Sigma) \cdot \pi(\gamma \mid \Sigma) \\ &\propto |\Sigma|^{\frac{-(\eta_0+p+1)}{2}} \exp \left\{ -\frac{1}{2} \text{tr}(\mathbf{S}_0 \Sigma^{-1}) \right\} \cdot \prod_{j=1}^J |\Sigma|^{-\frac{1}{2}} \exp \left\{ -\frac{1}{2} [\gamma_j^T \Sigma^{-1} \gamma_j] \right\} \\ &\propto |\Sigma|^{\frac{-(\eta_0+p+J+1)}{2}} \exp \left\{ -\frac{1}{2} \left[ \text{tr} [\mathbf{S}_0 \Sigma^{-1}] + \sum_{j=1}^J \gamma_j^T \Sigma^{-1} \gamma_j \right] \right\}, \\ &\propto |\Sigma|^{\frac{-(\eta_0+p+J+1)}{2}} \exp \left\{ -\frac{1}{2} \left[ \text{tr} [\mathbf{S}_0 \Sigma^{-1}] + \sum_{j=1}^J \text{tr} [\gamma_j \gamma_j^T \Sigma^{-1}] \right] \right\}, \\ &\propto |\Sigma|^{\frac{-(\eta_0+p+J+1)}{2}} \exp \left\{ -\frac{1}{2} \text{tr} \left[ \mathbf{S}_0 \Sigma^{-1} + \sum_{j=1}^J \gamma_j \gamma_j^T \Sigma^{-1} \right] \right\}, \\ &\propto |\Sigma|^{\frac{-(\eta_0+p+J+1)}{2}} \exp \left\{ -\frac{1}{2} \text{tr} \left[ \left( \mathbf{S}_0 + \sum_{j=1}^J \gamma_j \gamma_j^T \right) \Sigma^{-1} \right] \right\},\end{aligned}$$

# MCMC Sampling

- Model (1) leads to a simple Gibbs sampler if we use conditional (semi-) conjugate priors on  $\theta = (\beta, \Sigma, \phi = 1/\sigma^2)$
- Model (2) can be challenging to update the variance components! no conjugacy and need to ensure that MH updates maintain the positive-definiteness of  $\Sigma$  (can reparameterize)
- Is Gibbs always more efficient?
- No - because the Gibbs sampler can have high autocorrelation in updating the  $\{\gamma_j\}$  from their full conditional and then updating  $\theta$  from their full full conditionals given the  $\{\gamma_j\}$
- slow mixing
- update  $\beta$  using (2) instead of (1) (marginalization so is independent of  $\gamma_j$ 's)

# Marginal update for $\beta$

$$Y_j \mid \beta, \Sigma, \sigma^2 \stackrel{\text{ind}}{\sim} N(X_j\beta, Z_j\Sigma Z_j^T + \sigma^2 I_{n_j})$$
$$\beta \sim N(\mu_0, \Psi_0^{-1})$$

- Let  $\Phi_j = (Z_j\Sigma Z_j^T + \sigma^2 I_{n_j})^{-1}$  (precision in model 2)

$$\pi(\beta \mid \Sigma, \sigma^2, \mathbf{Y}) \propto |\Psi_0|^{1/2} \exp\left\{-\frac{1}{2}(\beta - \mu_0)^T \Psi_0(\beta - \mu_0)\right\} \cdot$$
$$\prod_{j=1}^J |\Phi_j|^{1/2} \exp\left\{-\frac{1}{2}(Y_j - X_j\beta)^T \Phi_j(Y_j - X_j\beta)\right\}$$
$$\propto \exp\left\{-\frac{1}{2}\left((\beta - \mu_0)^T \Psi_0(\beta - \mu_0) + \sum_j (Y_j - X_j\beta)^T \Phi_j(Y_j - X_j\beta)\right)\right\}$$

# Marginal Posterior for $\beta$

$$\pi(\beta \mid \Sigma, \sigma^2, \mathbf{Y}) \propto \exp \left\{ -\frac{1}{2} \left( (\beta - \mu_0)^T \Psi_0 (\beta - \mu_0) + \sum_j (Y_j - X_j \beta)^T \Phi_j (Y_j - X_j \beta) \right) \right\}$$

- precision

$$\Psi_n = \Psi_0 + \sum_{j=1}^J X_j^T \Phi_j X_j$$

- mean

$$\mu_n = \left( \Psi_0 + \sum_{j=1}^J X_j^T \Phi_j X_j \right)^{-1} \left( \Psi_0 \mu_0 + \sum_{j=1}^J X_j^T \Phi_j X_j \hat{\beta}_j \right)$$

where  $\hat{\beta}_j = (X_j^T \Phi_j X_j)^{-1} X_j^T \Phi_j Y_j$  is the generalized least squares estimate of  $\beta$  for group  $j$

# Full conditional for $\sigma^2$ or $\phi$

$$Y_j \mid \beta, \gamma_j, \sigma^2 \stackrel{ind}{\sim} N(X_j\beta + Z_j\gamma_j, \sigma^2 I_{n_j})$$

$$\gamma_j \mid \Sigma \stackrel{iid}{\sim} N(0, \Sigma)$$

$$\Sigma \sim \text{IW}_p(\eta_0, \mathbf{S}_0^{-1})$$

$$\beta \sim N(\mu_0, \Psi_0^{-1})$$

$$\phi \sim \text{Gamma}(v_0/2, v_o\sigma_0^2/2)$$

$$\pi(\phi \mid \beta, \{\gamma_j\}\{Y_j\}) \propto \text{Gamma}(\phi; v_0/2, v_o\sigma_0^2/2) \prod_j N(Y_j; X_j\beta + Z_j\gamma_j, \phi^{-1}I_{n_j}))$$

$$\phi \mid \{Y_j\}, \beta, \{\gamma_j\} \sim \text{Gamma}\left(\frac{v_0 + \sum_j n_j}{2}, \frac{v_o\sigma_0^2 + \sum_j \|Y_j - X_j\beta - Z_j\gamma_j\|^2}{2}\right)$$

# Full conditional for $\{\gamma_j\}$

$$Y_j \mid \beta, \gamma_j, \sigma^2 \stackrel{\text{ind}}{\sim} N(X_j\beta + Z_j\gamma_j, \sigma^2 I_{n_j})$$

$$\gamma_j \mid \Sigma \stackrel{\text{iid}}{\sim} N(0, \Sigma)$$

$$\Sigma \sim \text{IW}_p(\eta_0, \mathbf{S}_0^{-1})$$

$$\beta \sim N(\mu_0, \Psi_0^{-1})$$

$$\phi \sim \text{Gamma}(v_0/2, v_0\sigma_0^2/2)$$

$$\pi(\gamma \mid \beta, \phi, \Sigma) \propto N(\gamma_j; 0, \Sigma) \prod_j N(Y_j; X_j\beta + Z_j\gamma_j, \phi^{-1}I_{n_j}))$$

- work out as HW

# Resulting Gibbs Sampler

- Draw  $\beta, \gamma_1, \dots, \gamma_J$  as a block given  $\phi, \Sigma$  by
  - Draw  $\beta \mid \phi, \Sigma, Y$  then
  - Draw  $\gamma_j \mid \beta, \phi, \Sigma, Y$  for  $j = 1, \dots, J$
- Draw  $\Sigma \mid \gamma_1, \dots, \gamma_J, \beta, \phi, Y$
- Draw  $\phi \mid \beta, \gamma_1, \dots, \gamma_J, \Sigma, Y$
- Compare to previous Gibbs samplers
- How would you implement MH?
